X-RAY REPORT

BEARD, TOM

WC123764

November 6, 2000

AP, LATERAL, AND MERCHANT VIEWS OF THE LEFT KNEE reveal the presence of lateral patellar osteophyte formation. Medial joint space narrowing at 3 mm, unchanged from radiographs of 1999. There is suggestion of a fibular avulsion injury of the posterior aspect of the fibula. This could not be visualized on a prior radiograph due to overlapping soft tissue. This could represent an old injury, or possibly some heterotopic bone formation.

ASSESSMENT: Osteoarthritis, medial compartment right knee. ELC/jaq
