PELVIC ULTRASOUND

** HISTORY **:

** FINDINGS **:

Comparison: 04/14/2005. We do not have that examination but we have a report.

The current examination was done transabdominally and endovaginally. The previous study showed a large right ovary at 6.1 cm in maximum elliptical diameter with a 4.1 cm complex cyst therein.

RADIOLOGY REPORTS (continued)

Document Text

The current examination is done transabdominally and endovaginally. There was a small amount of free fluid in the cul-de-sac both anteriorly and posteriorly. The uterus measured sagittally 9.0 x 5.6 cm with the transverse dimension of 6.3 cm. The endometrial stripe is up to 2 cm and is somewhat prominent and slight irregularity suggested.

On the coronal imaging there is a tiny hypoechoic area approximately 4 mm in maximal diameter abutting the endometrial stripe just to the left which may represent a tiny fibroid. There were two nabothian cysts identified in the cervical plane, the larger of which measures approximately 6 mm in maximal diameter. The left adnexa measures 2.5 x 1.5 x 6.7 cm with an 8 mm hepatic developing follicle therein. The right adnexa measures 4.9 x 2.1 cm sagittally with a transverse dimension of 2.3 cm with a 16 x 19 x 13 mm hypoechoic areas therein with an adjacent hypoechoic change not truly cystic. These findings could represent the residua of a collapsing cyst as was described on the original examination of 04/14/2005, in the right adnexa. The uterus is very mildly retroverted.

**** IMPRESSION **:**

Some free fluid, modest amount, anteriorly and posteriorly with a somewhat prominent irregular endometrial stripe of approximately 2 cm in maximum thickness with a tiny hypoechoic area abutting the left side of the endometrial stripe on the coronal imaging suggesting a fibroid approximately 12 mm in maximal diameter. Incidental nabothian cyst, 2 in number.

8 mm follicle and a normal size left adnexa. Right adnexa is prominent having a maximal elliptical diameter of 4.9 cm but definitely smaller than that described on 04/14/2005, and with an echogenic area therein with adjacent slightly hypoechoic area possibly representing residual changes of a now collapsing complex cyst that was described on the examination of 04/14/2005.

Endometrial stripe prominence could relate to some endometrial hyperplasia.
