Document Text
MRI RIGHT KNEE

**** HISTORY **:**

knee pain rule out lateral meniscus tear

Technique: 1.5 Tesla multiplanar T1 and T2 weighted acquisitions

Comparison: None

**** FINDINGS **:**

Bones: Normal marrow signal findings.

Ligaments: Cruciate ligaments are intact. Medial and lateral collateral ligament structures of the knee are intact as well.

Menisci: Normal medial meniscus. Horizontal tear lateral meniscus extending from the meniscal body into the anterior horn. Tear intersects the superior articular surface near the articular apex. Furthermore, there is an associated para-meniscal cyst measuring 8 mm x 12 mm x 11 mm.

Joints: No articular surface abnormalities seen either weight-bearing compartment. No significant abnormality is seen at the patellofemoral joint. The median ridge of patella is satisfactorily seated relative to the trochlear groove. Patellar retinacula are intact. Extensor mechanism is preserved. Joint fluid does not appear to be increased

Periarticular soft tissues: No significant finding

**** IMPRESSION **:**

1. Horizontal tear lateral meniscus extending from the meniscal body into the anterior horn - tear does extend to the superior articular surface of the meniscus near the meniscal articular apex. There is an associated para-meniscal cyst.

RIGHT KNEE THREE VIEWS

** HISTORY **:
Chronic right knee pain

** FINDINGS **:
Bilateral standing AP knees with sunrise patella and right lateral knee views were obtained. Bony mineralization and alignment are normal with no evidence of fracture, bony erosion, or dislocation. Joint spaces are maintained.

** IMPRESSION **:
No diagnostic abnormality.
